

Create SEO Title Tags and Meta Descriptions

Task report | Sadhanala Nischay Prasad | October 2026

1. Objective

Write optimized title tags and meta descriptions for five website pages, choose a target keyword for each page, and explain the optimization choices, in order to understand basic on-page SEO.

2. Websites chosen

I picked **five different websites, one page from each**, so the task covers the main page types and search intents a real SEO job deals with: a local restaurant home page, an e-commerce product page, a blog post, a local clinic service page and a developer portfolio. The businesses are sample sites built for this exercise; the techniques apply to any real site.

3. Method

Keyword research (Google Search): for each website I searched candidate phrases and used Google autocomplete, the 'People also ask' box and related searches to see how real users word their queries. I also looked at the titles already ranking on page one to see what format Google rewards for that intent.

Intent mapping: each page got exactly one primary keyword matched to why people search for it: local, transactional, informational or navigational.

Writing and checking (Google Sheets): titles and descriptions were drafted in a sheet with LEN() formulas that flag anything over 60 characters (title) or 160 characters (meta), plus a COUNTIF check that every title and keyword is unique.

4. Summary of deliverables

Website / page	Target keyword	Title tag (chars)	Meta description (chars)
Spice Route Biryani (local restaurant) Home page	biryani restaurant in Bengaluru	Spice Route Biryani Biryani Restaurant in Bengaluru (53)	Slow-cooked Hyderabad dum biryani in Koramangala, Bengaluru. Dine in, take away or order home delivery. See the menu and book a table at Spice Route today. (156)
GadgetKart (e-commerce store) Product page	boAt Airdopes 141	boAt Airdopes 141 Wireless Earbuds: Price & Offers (50)	Buy boAt Airdopes 141 with up to 42 hours of playback, ENx tech for clear calls and low-latency BEAST mode. Check today's price, offers and fast delivery. (154)
CodeWithNischay (tech blog) Blog post	learn Python for beginners	Learn Python for Beginners: A Step-by-Step Roadmap (50)	New to coding? Learn Python for beginners with a clear roadmap: setup, basics, small projects and free practice resources. Start writing real code this week. (157)
SmileCare Dental Clinic (local service) Service page	teeth whitening in Pune	Teeth Whitening in Pune SmileCare Dental Clinic (49)	Professional teeth whitening in Pune by qualified dentists. Safe, single-visit treatment with a free consultation to discuss shade and cost. Book online today. (159)
Nischay Prasad (developer portfolio) Home page	full stack developer portfolio	Nischay Prasad Full Stack Developer Portfolio (47)	Full stack engineer building web and AI apps with React, Node.js and Python. Explore projects like ScamShield, see my GitHub and get in touch to work together. (159)

5. Page-by-page optimization explanation

5.1 Spice Route Biryani (local restaurant): Home page

URL: spiceroutebiryani.in/ **Search intent:** Local / commercial

Target keyword: biryani restaurant in Bengaluru **Secondary:** best biryani near me, Hyderabadi biryani Bengaluru, biryani home delivery

Title: Spice Route Biryani | Biryani Restaurant in Bengaluru

Meta: Slow-cooked Hyderabadi dum biryani in Koramangala, Bengaluru. Dine in, take away or order home delivery. See the menu and book a table at Spice Route today.

Why it works: Local searches include the city, so the keyword pairs the dish with 'Bengaluru'. The brand comes first because a restaurant's name is what returning customers search for. The meta gives the area (Koramangala) as a local signal, names the specific style (dum biryani) to set it apart, lists the three ways to order and ends with two calls to action.

5.2 GadgetKart (e-commerce store): Product page

URL: gadgetkart.in/boat-airdopes-141 **Search intent:** Transactional

Target keyword: boAt Airdopes 141 **Secondary:** boAt Airdopes 141 price, wireless earbuds under 1500, TWS earbuds

Title: boAt Airdopes 141 Wireless Earbuds: Price & Offers

Meta: Buy boAt Airdopes 141 with up to 42 hours of playback, ENx tech for clear calls and low-latency BEAST mode. Check today's price, offers and fast delivery.

Why it works: Shoppers search the exact model name, so it opens the title, followed by the product type. 'Price & Offers' matches what buyers add to their search when they are ready to purchase. The meta leads with 'Buy' and the three specs people compare most, then answers their next questions (price, offers, delivery). Specs are taken from the product listing so the description stays accurate.

5.3 CodeWithNischay (tech blog): Blog post

URL: codewithnischay.dev/learn-python-beginners **Search intent:** Informational

Target keyword: learn Python for beginners **Secondary:** Python roadmap, Python basics, how to start coding in Python

Title: Learn Python for Beginners: A Step-by-Step Roadmap

Meta: New to coding? Learn Python for beginners with a clear roadmap: setup, basics, small projects and free practice resources. Start writing real code this week.

Why it works: The title is the phrase beginners type into Google, with a promise ('step-by-step roadmap') that tells them the format of the article. The meta speaks directly to the reader ('New to coding?'), repeats the keyword once, previews the four sections of the post and ends with an achievable outcome that encourages the click.

5.4 SmileCare Dental Clinic (local service): Service page

URL: smilecaredental.in/teeth-whitening **Search intent:** Local / commercial

Target keyword: teeth whitening in Pune **Secondary:** teeth whitening cost, professional teeth whitening, dentist Pune

Title: Teeth Whitening in Pune | SmileCare Dental Clinic

Meta: Professional teeth whitening in Pune by qualified dentists. Safe, single-visit treatment with a free consultation to discuss shade and cost. Book online today.

Why it works: Service plus city is the standard local search pattern, and it opens the title. The clinic name comes after the separator to build trust. The meta stresses safety and qualified dentists, which matters for medical services, answers the cost question people have without promising a price, and ends with an easy next step. It avoids results claims like 'guaranteed white teeth', which would be misleading.

5.5 Nischay Prasad (developer portfolio): Home page

URL: nischayprasad.dev/ **Search intent:** Navigational / commercial

Target keyword: full stack developer portfolio **Secondary:** React Node.js developer, full stack engineer India, hire full stack developer

Title: Nischay Prasad | Full Stack Developer Portfolio

Meta: Full stack engineer building web and AI apps with React, Node.js and Python. Explore projects like ScamShield, see my GitHub and get in touch to work together.

Why it works: Recruiters search a person's name or their role, so the title has both: name first for navigational searches, role and 'portfolio' for discovery. The meta states the stack recruiters filter by, points to a real project as proof of work, and closes with a clear contact call to action.

6. On-page SEO principles applied

- **Length:** Titles 47-53 characters and descriptions 154-159 characters, so neither is cut off in results.
- **Keyword placement:** The keyword leads each title, or follows the brand where people search the brand itself, and appears naturally in each description.
- **Uniqueness:** Five unique titles and five unique keywords, each written for its own page type.
- **Search intent:** Local pages name the city, the product page says price and offers, the blog promises a roadmap, the portfolio leads with the name.
- **Clear value and CTA:** Each description tells the reader what they get and, where it fits, what to do next.
- **Honesty:** No 'best' or '#1' claims, product specs taken from the listing, and no guaranteed results on the medical page.

7. Key learnings

The title tag is a promise and the meta description is the pitch. Google may rewrite either one, but a clear, accurate, keyword-led version is what it most often keeps. Writing for the person scanning the results page, not for the algorithm, produced better copy than stuffing keywords. Different page types need different formulas: local pages need the city, product pages need buying words, and blog posts need the reader's exact question.
