

Create SEO Title Tags and Meta Descriptions

Task report | Sadhanala Nischay Prasad | October 2026

1. Objective

Write optimized title tags and meta descriptions for five website pages, choose a target keyword for each page, and explain the optimization choices, in order to understand basic on-page SEO.

2. Website chosen

ScamShield, my open-source Android app that checks SMS, WhatsApp messages and UPI payment screenshots for scam signs using on-device AI (github.com/SNischayPrasad/Scam-Shield). The five pages below form the planned structure of its project website: a home page, a how-it-works page, a download page and two scam-awareness guides. The audience is everyday smartphone users in India.

3. Method

Keyword research (Google Search): for each page I searched candidate phrases and used Google autocomplete, the 'People also ask' box and related searches to see how real users word their queries. I also looked at the titles already ranking on page one to see what format Google rewards for that intent.

Intent mapping: each page got exactly one primary keyword matched to its purpose (commercial, informational or transactional), so no two pages compete for the same search.

Writing and checking (Google Sheets): titles and descriptions were drafted in a sheet with LEN() formulas that flag anything over 60 characters (title) or 160 characters (meta), plus a COUNTIF check that every title and keyword is unique.

4. Summary of deliverables

Page	Target keyword	Title tag (chars)	Meta description (chars)
Home	scam message checker	Scam Message Checker for SMS & WhatsApp ScamShield (52)	Check suspicious SMS, WhatsApp and UPI messages in seconds. ScamShield flags scams right on your phone, with no uploads and no sign-up. Try the demo today. (155)
How It Works	on-device scam detection	On-Device Scam Detection: How ScamShield Works (46)	ScamShield analyses messages on your Android phone with on-device AI, so your texts never leave your device. See how scam detection works, step by step. (152)
Download	scam detection app for Android	Download ScamShield: Scam Detection App for Android (51)	Get ScamShield for Android and scan SMS, WhatsApp and UPI payment screenshots for scam signs. Lightweight, private and runs in the background. Download now. (156)
UPI Fraud Guide	how to identify UPI fraud	How to Identify UPI Fraud: Warning Signs & Tips (47)	Fake payment requests, QR code tricks and refund calls: learn the warning signs of UPI fraud and what to do if you have been targeted. Stay safe online. (152)
WhatsApp Scam Guide	WhatsApp scam messages	WhatsApp Scam Messages: Common Tricks & How to Spot Them (56)	Job offers, KYC alerts and lottery wins: see the most common WhatsApp scam messages in India and quick checks to spot them before you reply or click any link. (158)

5. Page-by-page optimization explanation

5.1 Home /

Target keyword: scam message checker **Secondary:** SMS scam checker, WhatsApp scam check, UPI scam

Title: Scam Message Checker for SMS & WhatsApp | ScamShield

Meta: Check suspicious SMS, WhatsApp and UPI messages in seconds. ScamShield flags scams right on your phone, with no uploads and no sign-up. Try the demo today.

Why it works: Primary keyword sits at the very start of the title, where Google and users weigh it most. 'SMS & WhatsApp' names the two channels people actually search for. Brand goes last so it never pushes the keyword out of view. The meta repeats the keyword idea, lists the three message types the app handles, states two differentiators (no uploads, no sign-up) and ends with a clear call to action.

5.2 How It Works /how-it-works

Target keyword: on-device scam detection **Secondary:** offline scam detection, AI scam detector, private scam check

Title: On-Device Scam Detection: How ScamShield Works

Meta: ScamShield analyses messages on your Android phone with on-device AI, so your texts never leave your device. See how scam detection works, step by step.

Why it works: Leads with the exact keyword and uses a colon to separate the topic from the promise of the page. This is the only page targeting 'on-device', so it does not compete with the Home page. The meta answers the biggest worry users have (privacy) and tells them what they will find on the page (a step-by-step explanation), which matches search intent for a 'how it works' query.

5.3 Download /download

Target keyword: scam detection app for Android **Secondary:** scam blocker app, fraud message detector app, anti-scam app India

Title: Download ScamShield: Scam Detection App for Android

Meta: Get ScamShield for Android and scan SMS, WhatsApp and UPI payment screenshots for scam signs. Lightweight, private and runs in the background. Download now.

Why it works: Starts with the action verb 'Download', matching transactional intent: people searching this want to install something. The keyword follows immediately and includes the platform so iPhone users are not misled. The meta lists concrete features (three input types, background scanning) and closes with a direct call to action.

5.4 UPI Fraud Guide /guides/upi-fraud

Target keyword: how to identify UPI fraud **Secondary:** UPI scam signs, fake payment request, QR code scam

Title: How to Identify UPI Fraud: Warning Signs & Tips

Meta: Fake payment requests, QR code tricks and refund calls: learn the warning signs of UPI fraud and what to do if you have been targeted. Stay safe online.

Why it works: Uses the question exactly as people type it into Google, which matches informational intent and is likely to earn clicks from People Also Ask style results. The brand is left out of the title to keep it under 60 characters and keep the focus on the reader's problem. The meta opens with three specific scam types the reader will recognise, then promises both detection and next steps.

5.5 WhatsApp Scam Guide </guides/whatsapp-scams>

Target keyword: WhatsApp scam messages **Secondary:** WhatsApp job scam, fake KYC message, lottery scam WhatsApp

Title: WhatsApp Scam Messages: Common Tricks & How to Spot Them

Meta: Job offers, KYC alerts and lottery wins: see the most common WhatsApp scam messages in India and quick checks to spot them before you reply or click any link.

Why it works: Keyword at the front, followed by a two-part benefit (what the tricks are and how to spot them). It targets a different platform and keyword from the UPI guide, so the two guides do not cannibalise each other. The meta uses familiar examples that Indian users receive daily, adds a location signal ('in India') and ends with a practical reason to read now.

6. On-page SEO principles applied

- **Length:** Titles 46-56 characters and descriptions 152-158 characters, so neither is cut off in results.
- **Keyword placement:** The target keyword appears at or near the start of every title and naturally once in every description.
- **Uniqueness:** Five unique titles and five unique keywords, which avoids keyword cannibalisation between pages.
- **Search intent:** Wording matches what the searcher wants: to learn, to compare or to download.
- **Clear value and CTA:** Each description tells the reader what they get and, where it fits, what to do next.
- **Honesty:** No 'free', 'best' or '#1' claims and no numbers the page cannot support; the platform (Android) is stated so iPhone users are not misled.

7. Key learnings

The title tag is a promise and the meta description is the pitch. Google may rewrite either one, but a clear, accurate, keyword-led version is what it most often keeps. Writing for the person scanning the results page, not for the algorithm, produced better copy than stuffing keywords. Planning one keyword per page up front made it easy to keep every title unique.
